Trustworthiness Check for Nodes Reporting Measurements in CoMaDa

• Ensuring that only trustworthy device can send to gateway

• Currently every device registered in network can communicate towards gateway.
• Bad nodes can also participate if they know the right settings and protocols of network → wrong data → bad reactions in system

• ToDos:
  • Design and implement a „Trust-Check“ concept
  • Integration into logging system
  • Warning the owner (e.g., mailing, visual notification)

• Location on Gateway component CoMaDa
